tances — has long been accepted as standard among industry experts due to the advantages and disadvantages of each technology.

But things are changing. Now what we're seeing is that contrary to a few years ago, electric trucks and buses are actually playing an increasingly big role and we also see a very important role for them to play in the decarbonisation (process), said Fedor Unterlohner, freight manager at NGO Transport and Environment.

Heavy duty vehicles account for six per cent of the European Union's greenhouse gas emissions.

Brussels has called for the industry to reduce its emissions by 45 per cent compared to 2019 levels by 2030, and by 90 per cent by 2040.

According to a study conducted last year by German authorities, truckmakers expect 63 per cent of new lorries sold in Europe in 2030 to be 'zero emission' vehicles.

Electric trucks are expected to make up the lion's share, with 85 per cent.

That's because previous concerns about electric trucks have been eliminated as, unlike hydrogen, the technology for electric trucks has benefitted from advances made in the electric car industry.

Most heavy trucks in Europe drive fewer than 800 kilometres a day, a distance that could soon be within reach of electric batteries especially given drivers' strictly regulated breaks, meaning which they can recharge their vehicles.

The amount of energy batteries can store continues to improve, to the point where the weight difference compared to a diesel truck expected to become insignificant.

So-called megawatt charging stations are currently being developed and could soon be able to provide 10 times more power than the fastest charging stations currently available.
